

5 Door Security Devices That Make Your Home Harder to Break Into

Most home break-ins happen through the front door — and a standard deadbolt is often the only thing standing between an intruder and your family. The problem is, a basic lock was never engineered to handle a determined kick. That gap in protection is exactly why [door security devices](#) have become one of the fastest-growing home safety categories in the US.

The good news is that upgrading your door security doesn't require expensive hardware or a professional installer. Today's best options are affordable, practical, and strong enough to stop forced entry before it becomes a real threat.

What Actually Works

The most effective **door reinforcement solutions** fall into two categories. The first is bar-style door jammers — adjustable bars that brace against the floor and resist up to 400 lbs of force without any installation. The second is screw-mounted flip locks that attach directly to the door frame and withstand up to 800 lbs, making them nearly impossible to kick through.

Both approaches work. The right choice depends on whether you rent or own, travel frequently, or need childproofing built into the design.

Who Needs One

- Renters who can't modify existing locks
- Solo travelers staying in hotels or Airbnbs
- Parents who need childproof door protection
- Homeowners wanting a stronger second layer beyond their deadbolt

The Bottom Line

No single lock covers every situation. The smartest approach combines a quality deadbolt with a secondary [door barricade device](#) — giving any intruder two problems instead of one.
